qLearn Week 3: Single Qubit Quantum Gates

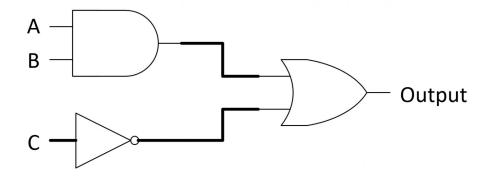

Michael Silver, ECE 2T6
University of Toronto Quantum Computing Club

Last Week Recap

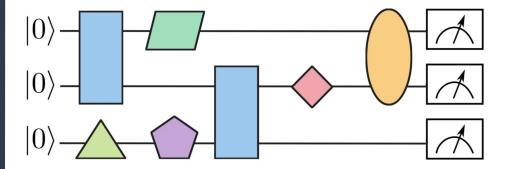

Classical Circuits

- Boolean Logic

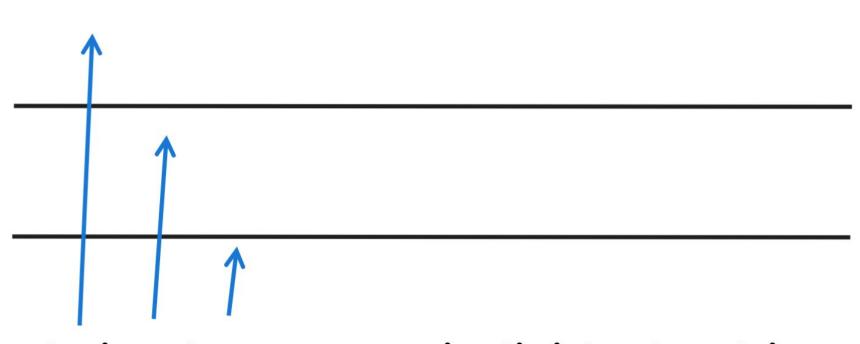

- Binary logic (0 and 1 inputs and outputs)
- Physical gates and wiring
- Different types of gates indicate different operations
- Every computer calculation and operation is a result of these circuits

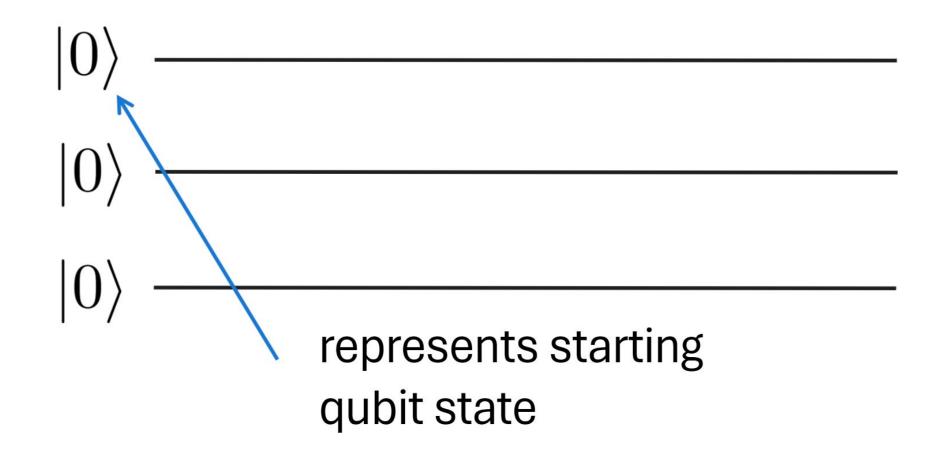

Quantum Circuits

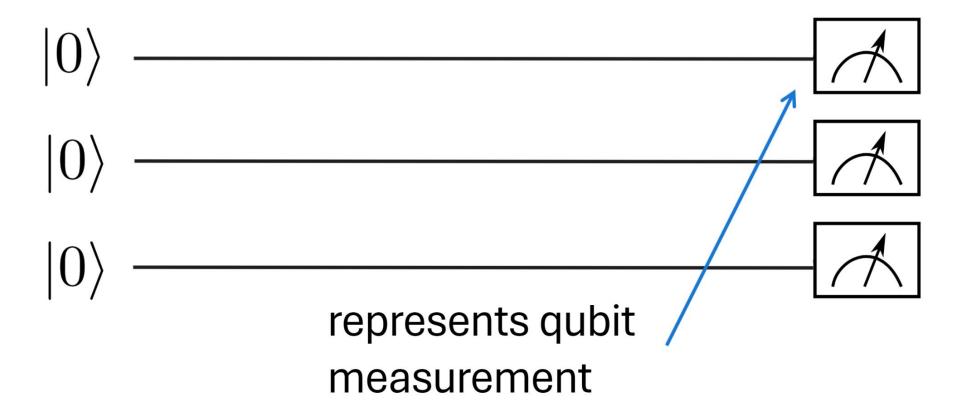

- <u>Visual</u> representation of operations being made on a qubit (very complicated physics, learn more in hardware section!!!)
- Represented by linear algebraic transformations mathematically
- Contains information about quantum algorithms, visual representation of them

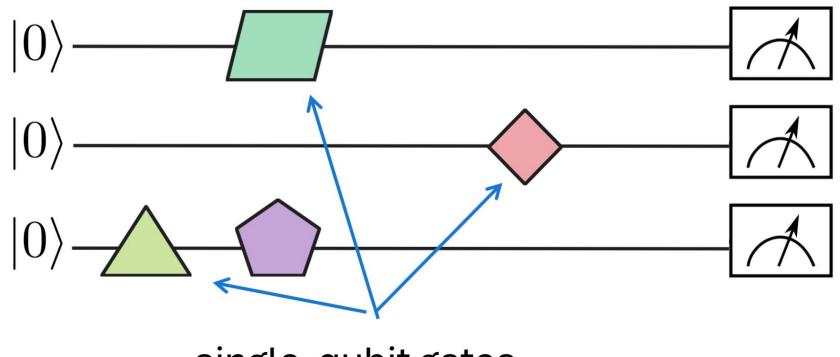

'wires' represent individual qubits

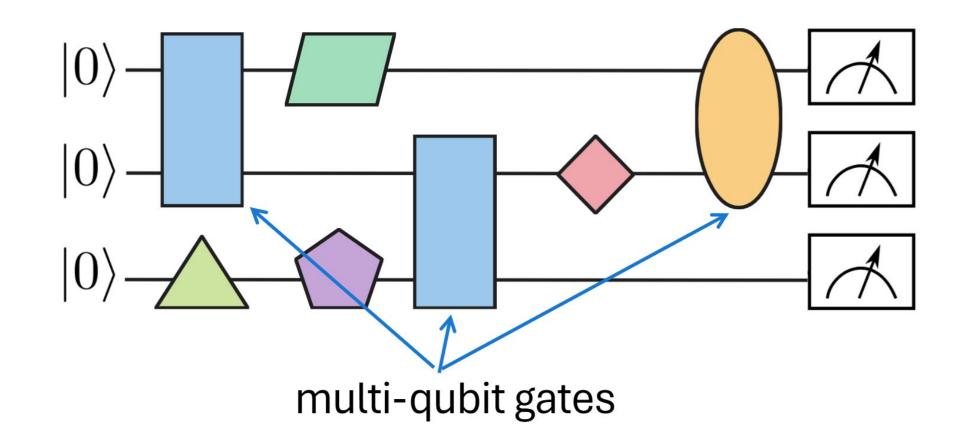

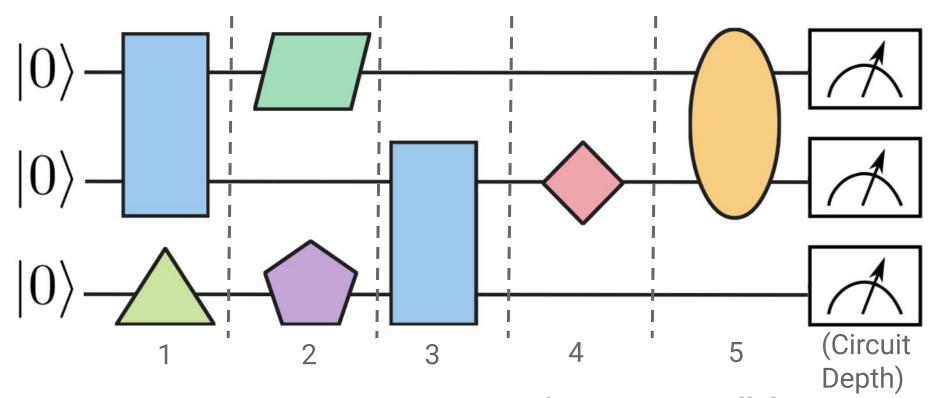

**NOTE: Does not always have to go at end of circuit!!! We will see examples later

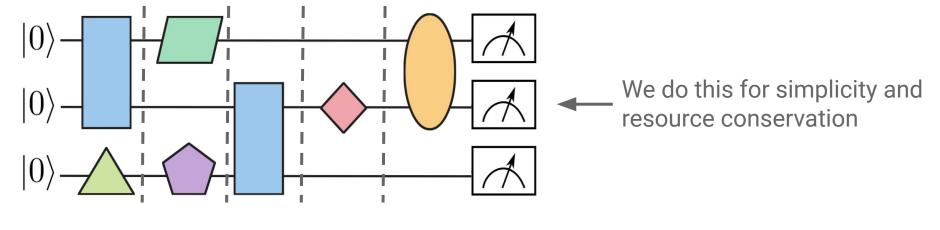

single-qubit gates

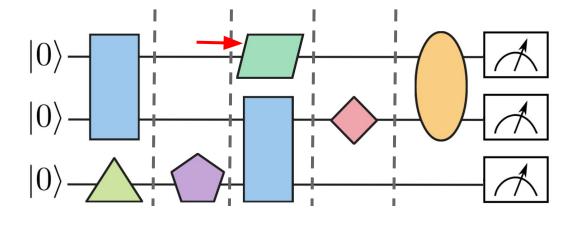

Gates acting on seperate qubits act in parallel

Is **EQUAL** to

New Topic: Unitary Matrices!!

Key Vocab:

- Identity: Square matrix with 1s on diagonal and 0s elsewhere
- 2) Transpose^T: flipped matrix values over its diagonal
- 3) Conjugate* (for this lecture's sake): sign of imaginary part of a complex number is flipped

As previously mentioned, qubit operations are represented **mathematically** as **unitary matrices**

What is a unitary matrix and why do we use them?

- Qubit state vectors are normalized, as in they always have length 1
- Unitary matrices have special properties that, when applied to qubit state vectors, preserve their length

A $n \cdot n$ matrix U is unitary if

$$UU^{\dagger} = U^{\dagger}U = I_n$$

Where I_n represents the n-dimensional identity, and U^\dagger is the notation for the conjugate transpose of U

How do these represent qubit transformations???

Proof: Representing a Unitary in Polar Form

For unitary with complex elements

$$U = egin{bmatrix} a & b \ c & d \end{bmatrix}$$

Write each element in their polar forms

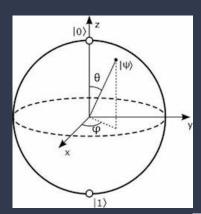

$$\begin{split} a &= e^{i\alpha}\cos(\theta/2), b = -e^{i(\beta-\gamma)}\sin(\theta/2) \\ c &= e^{i\gamma}\sin(\theta/2), d = e^{i(\beta-\alpha)}\cos(\theta/2) \\ U &= \begin{pmatrix} e^{i\alpha}\cos(\theta/2) & -e^{i(\beta-\gamma)}\sin(\theta/2) \\ e^{i\gamma}\sin(\theta/2) & e^{i(\beta-\alpha)}\cos(\theta/2) \end{pmatrix} \end{split}$$

Using substitutions: $\phi = \beta - \alpha - \gamma, \omega = \gamma - \alpha$ (and phases, will discuss soon!!) We obtain:

$$U(\phi, \theta, \omega) = \begin{pmatrix} e^{-i(\phi+\omega)/2} \cos(\theta/2) & -e^{i(\phi-\omega)/2} \sin(\theta/2) \\ e^{-i(\phi-\omega)/2} \sin(\theta/2) & e^{i(\phi+\omega)/2} \cos(\theta/2) \end{pmatrix}$$

Parameterization of a unitary matrix!!

The Bloch Sphere

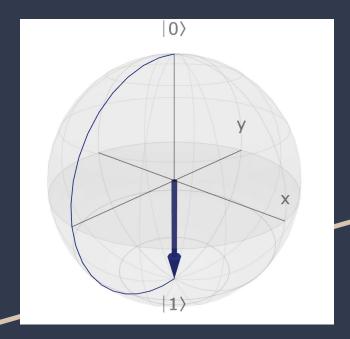

- Who is **Bloch**?
- 3-D Visualization of qubit state
- Representation of qubit state and operations

https://bloch.kherb.io/

Single-Qubit Quantum Gates

Pauli X Gate

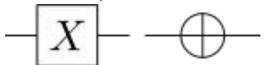

-> Similar to a classical NOT Gate

$$X|0\rangle = |1\rangle$$

$$X|1\rangle = |0\rangle$$

-> Geometrically, 180° rotation around x-axis in Bloch sphere

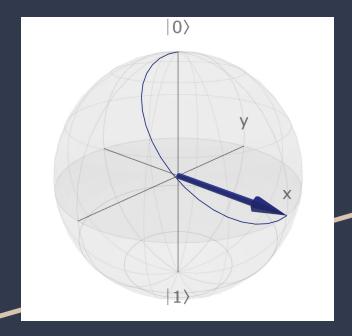

->Gate representation

-> Matrix representation

$$X = egin{bmatrix} 0 & 1 \ 1 & 0 \end{bmatrix}$$

H (Hadamard) Gate

-> Creates a uniform superposition of states

$$H|0
angle=rac{1}{\sqrt{2}}(|0
angle+|1
angle)=|+
angle$$

$$H|1
angle=rac{1}{\sqrt{2}}(|0
angle-|1
angle)=|-
angle$$

-> Geometrically, reflection over the diagonal of the XZ plane in Bloch sphere

H

-> Matrix representation

$$H=rac{1}{\sqrt{2}}egin{bmatrix}1&1\1&-1\end{bmatrix}$$

Code Break!

A Note on Phases

$$egin{aligned} |\psi
angle &= lpha |0
angle + eta |1
angle \ &lpha = ae^{i heta}, eta = be^{iarphi} \ |\psi
angle &= ae^{i heta} |0
angle + be^{iarphi} |1
angle \ &= e^{i heta} (a|0
angle + be^{i(arphi - heta)} |1
angle) \ &= a|0
angle + be^{i(arphi - heta)} |1
angle \end{aligned}$$

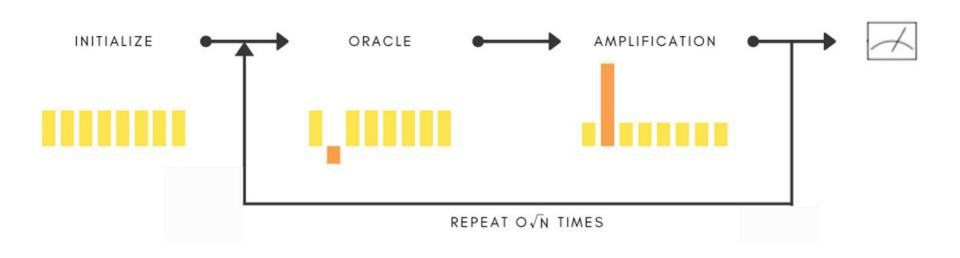

Global Phase:

- Transformation that multiplies the <u>entire</u> state by a complex number of unit magnitude
- Note: No observable impact on measurement probabilities

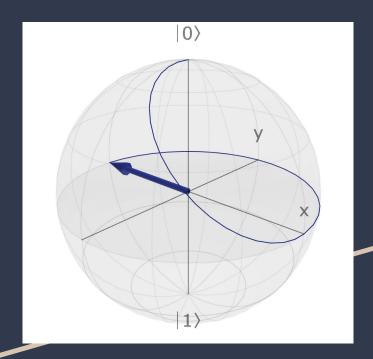

Relative Phase:

- Changes the phase relationship between the components of a superposition state
- Non-uniform impact on probabilities, thus affects measurement outcomes

Example of Relative Phase Use in Algorithm

Pauli Z Gate

-> 'Flips' the phase of the state

$$egin{aligned} Z|0
angle
ightarrow |0
angle \ Z|1
angle
ightarrow -|1
angle \ Z|+
angle = rac{1}{\sqrt{2}}(|0
angle -|1
angle) = |-
angle \end{aligned}$$

$$Z|-
angle=rac{1}{\sqrt{2}}(|0
angle+|1
angle)=|+
angle$$

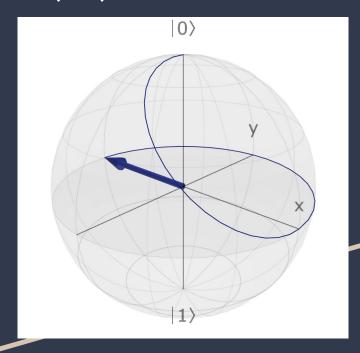

-> Geometrically, 180° rotation around Z-axis

-> Matrix representation

$$Z = egin{bmatrix} 1 & 0 \ 0 & -1 \end{bmatrix}$$

RZ, S, T Gates

-> 'Rotates' the phase of the state

$$RZ(\omega)|\psi
angle=lpha|0
angle+eta e^{i\omega}|1
angle$$

- -> Geometrically, ω rotation around Z-axis
- ->Gate representation

-> Matrix representation

$$RZ(\omega) = egin{bmatrix} e^{-irac{\omega}{2}} & 0 \ 0 & e^{irac{\omega}{2}} \end{bmatrix}$$

- -> Pauli Z is just $RZ(\pi)$
- -> S is $RZ(\pi/2)$
- \rightarrow T is RZ(π /4)

RX, RY,Y Gates

$$|\psi
angle = a|0
angle + be^{i\phi}|1
angle$$
 $a^2 + b^2 = 1, a = cos(\theta/2), b = sin(\theta/2)$
 $|\psi
angle = cos(\theta/2)|0
angle + sin(\theta/2)e^{i\phi}|1
angle$
 $RX(\theta)|0
angle = cos\frac{\theta}{2}|0
angle - isin\frac{\theta}{2}|1
angle$
 $RX(\theta)|1
angle = -isin\frac{\theta}{2}|0
angle + cos\frac{\theta}{2}|1
angle$
 $RY(\theta)|0
angle = cos\frac{\theta}{2}|0
angle + sin\frac{\theta}{2}|1
angle$
 $RY(\theta)|1
angle = -sin\frac{\theta}{2}|0
angle + cos\frac{\theta}{2}|1
angle$

- -> Used in precisely altering qubit state
- -> Geometrically, ω rotation around respective axes
- ->Gate representation
- -> Matrix representation

$$RX(heta) = egin{bmatrix} \cos(rac{ heta}{2}) & -i\sin(rac{ heta}{2}) \ -i\sin(rac{ heta}{2}) & \cos(rac{ heta}{2}) \end{bmatrix}$$

$$RY(heta) = egin{bmatrix} \cos(rac{ heta}{2}) & -\sin(rac{ heta}{2}) \ \sin(rac{ heta}{2}) & \cos(rac{ heta}{2}) \end{bmatrix}$$

$$U(\phi, \theta, \omega) = \begin{pmatrix} e^{-i(\phi+\omega)/2} \cos(\theta/2) & -e^{i(\phi-\omega)/2} \sin(\theta/2) \\ e^{-i(\phi-\omega)/2} \sin(\theta/2) & e^{i(\phi+\omega)/2} \cos(\theta/2) \end{pmatrix}$$

Code Break!

$$RX(heta) = egin{bmatrix} \cos(rac{ heta}{2}) & -i\sin(rac{ heta}{2}) \ -i\sin(rac{ heta}{2}) & \cos(rac{ heta}{2}) \end{bmatrix}$$

 $RY(heta) = egin{bmatrix} \cos(rac{ heta}{2}) & -\sin(rac{ heta}{2}) \ \sin(rac{ heta}{2}) & \cos(rac{ heta}{2}) \end{bmatrix}$

$$RZ(\omega) = egin{bmatrix} e^{-irac{\omega}{2}} & 0 \ 0 & e^{irac{\omega}{2}} \end{bmatrix}$$

Universal Gates

$$U(\phi, \theta, \omega) = \begin{pmatrix} e^{-i(\phi+\omega)/2} \cos(\theta/2) & -e^{i(\phi-\omega)/2} \sin(\theta/2) \\ e^{-i(\phi-\omega)/2} \sin(\theta/2) & e^{i(\phi+\omega)/2} \cos(\theta/2) \end{pmatrix}$$

-> Example: Show that the unitary can be expressed using only 3 gates from the set {RZ, RY}

$$Rz(\phi) = egin{bmatrix} e^{-i\phi/2} & 0 \ 0 & e^{i\phi/2} \end{bmatrix}$$

$$Ry(\theta) = egin{bmatrix} \cos(heta/2) & -\sin(heta/2) \ \sin(heta/2) & \cos(heta/2) \end{bmatrix}$$

$$Rz(\omega) = egin{bmatrix} e^{-i\omega/2} & 0 \ 0 & e^{i\omega/2} \end{bmatrix}$$

$$U(\phi, \theta, \omega) = Rz(\omega)Ry(\theta)Rz(\phi)$$

Equivalent Gate Identities

1)
$$H = Ry(\frac{\pi}{2})Rx(\pi)$$

2)
$$Ry(\theta) = Rz(-\frac{\pi}{2})Rx(\theta)Rz(\frac{\pi}{2})$$

3)
$$Rx(\theta) = Rz(\frac{\pi}{2})Ry(\theta)Rz(-\frac{\pi}{2})$$

4)
$$Rz(\theta) = Ry(\frac{\pi}{2})Rx(\theta)Ry(-\frac{\pi}{2})$$

5)
$$U(\phi, \theta, \omega) = Rz(\omega)Ry(\theta)Rz(\phi)$$

Quantum Gates Cheat Sheet

See you next week!
